

Mosquito source reduction to reduce the mosquito population. E.g. larval control, environmental management.

Prompt and effective treatment (aided by good diagnostics) to: (i) prevent disease progression and (ii) limit availability of parasites in blood that a mosquito will pick up to continue the transmission cycle

Methods to reduce the lifespan of mosquitoes, so they cannot survive long enough to develop the parasite to the correct stage for further transmission. E.g. Indoor residual spraying

Bite prevention to stop healthy people being infected via the bite of an infected mosquito: Insecticide treated nets, IRS, window, eaves and door screening, repellents etc.
