Seasonal malaria chemoprevention (SMC) is a highly effective community-based intervention to prevent malaria infections in areas where the malaria burden is high and transmission occurs mainly during the rainy season. It involves administering monthly courses of sulfadoxine-pyrimethamine (SP) and amodiaquine (AQ) during this peak transmission period to those most at risk: children under five. In 2019, SMC was implemented in 13 countries in the Sahel region of Africa, targeting over 21 million children.\(^1\)

Malaria Consortium has been a leading implementer since the World Health Organization (WHO) issued its recommendation to scale up SMC in 2012.\(^2\) With our partners, we led the rapid scale-up through the Achieving Catalytic Expansion of Seasonal Malaria Chemoprevention in the Sahel (ACCESS-SMC) project in 2015–2017, reaching close to seven million children in Burkina Faso, Chad, Guinea, Mali, Niger, Nigeria and The Gambia. This project demonstrated that SMC is cost-effective, safe and that high coverage can be achieved at scale.\(^3,4\)

Since 2018, we have continued to support national malaria programmes in Burkina Faso, Chad, Nigeria and Togo, reaching over 12 million children in 2020.\(^5\) We
also started a research project in Mozambique to explore the feasibility and impact of SMC outside the Sahel. We will continue to support efforts to minimise the risk of COVID-19 transmission to SMC implementers and communities by applying strict infection prevention and control guidelines and procuring COVID-19-related commodities, including face masks and hand sanitiser. Our lessons from implementing SMC during the pandemic in 2020 have been published in a learning paper.[6]

Project outline and objectives
SMC campaigns are implemented under the leadership of national malaria programmes and through countries’ existing health system structures. We provide technical and logistical support on all SMC activities. We also conduct research and engage with the international SMC community to build the evidence base for SMC and to contribute to SMC policy and practice. In 2021, our programme aims to reach more than 16 million children in Burkina Faso, Chad, Nigeria and Togo. We will continue our research in Mozambique and have started a similar study in Uganda.

Activities

- **Planning and enumeration**: Planning starts several months before the annual SMC round. This involves determining timelines, estimating the target population of under-fives, and recruiting community distributors and supervisors.

- **Procurement and supply management**: The SMC drugs are shipped from the manufacturer to the central warehouses in SMC-implementing countries. Along with other SMC commodities, they are then distributed to health facilities.

- **Community engagement**: To ensure high acceptability among communities, we conduct sensitisation meetings with local leaders, broadcast radio spots and enlist town announcers to disseminate information during the SMC round.

- **Training**: Before the start of the SMC round, all community distributors and supervisors are trained on how to administer SMC drugs.

- **SMC distribution**: Community distributors go door-to-door to identify eligible children and administer the SMC medicines.

- **Case management and pharmacovigilance**: Community distributors refer sick children to health facilities, where they are tested for malaria. If children test positive, they will be treated with an effective antimalarial. While SMC is safe, systems are in place to monitor and respond to adverse reactions.

- **Supervision**: Supervisors observe how community distributors administer the SMC drugs and provide constructive feedback. Facility-based health workers and health authority staff support supervisors.

- **Monitoring and evaluation**: Community distributors collect administrative data on the number of children reached. Data on stock consumption are collected through the supply management system. To assess coverage and quality of SMC implementation, we conduct independent household surveys.
